Acknowledgements

There are many people who have contributed to this thesis in unexpected and profound ways.

Firstly I would like to thank my supervisor Dr Margaret Somerville without whom I would not have had the courage or inspiration to start the process. Her expertise as a supervisor and her elegant and insightful analytical skills flow through the very essence of this thesis. Her dedication to her work has meant that she has devoted far too much time from her study leave to sustaining me to the end of this process. For the countless conversations, generosity of thought and spirit I thank you, Margaret.

I would like to thank Kerith for going far beyond the call of duty and offering her comments and proofreading this thesis, while on study leave.

I particularly want to thank all the people that shared their stories and parts of their lives with me. Many of you do not wish to be names, but would like your voices to be heard. I hope that I have been able to honour this. Helen thank you for your honesty, courage and time. I also would like to honour both Gracie and her family here, and thank them for allowing me the privilege of her smile and her sense of humour.

I would like to thank the women of the fiery cottage: Adele; Fran; Helen; Jenny; Kerith; and Phoenix; for their ongoing support and conversations. Without your contributions and questions this thesis would be far poorer.

I commend the excellence of the staff of St Vincent’s diabetes centre, in particular Penny, Jan and Gerry, as well as Michelle - thank you for being as committed to my wellbeing as I am and for being as open to engaging in the ‘ethical moment’ as you are.

I would like to thank my family. My sister, Jill, for listening, always. My children, Jacques, Daniel and Viv, for believing that one day ‘when the thesis is finished we will...’ And Peter for catching the baby and never once complaining because he was left holding the baby. Thank you for your wonderful patience, support and love.
Abstract

This thesis, 'And now I am going walking: body learning in diabetes education' is a feminist poststructural exploration of body learning in diabetes education. It starts with the research question “How do we learn our bodies and what does this reveal about diabetes education?” and concludes with a set of principles for learning and teaching diabetes education that can be applied to any aspect of learning the body. The thesis looks at the ways feminist poststructural theory is, and can be, applied to the very practical considerations of body learning. Data is gathered from personal observation, interviews, informal conversations, and print based diabetes education materials. The main analytical strategy is to place bodily experience at the centre of analysis and to read the body as both text and analytical tool. It employs a range of different writing genres including poetry, a play, short stories and personal journal writing as well as expository academic text. The research found that an understanding of site is necessary to reveal the ways that some knowledges are privileged over others. In the process of creating identities people in the medical site both include and simultaneously exclude people with diabetes. The body and embodiment are central in understanding any process of diabetes education. In body learning play and playfulness are aspects of transformational learning of new subjectivities. This writing opens up possibilities for understanding intertextually the profound nature of body learning as learning about the condition of being alive, far beyond the scope of learning to live with diabetes.
