Abstract

This study is concerned with the sources of Indonesian natural rubber price instability over the period 1966 to 1992. The main intention is to trace back the price instability into the pattern of supply and demand variability, as well as supply-demand interaction effects, using a decomposition procedure.

An econometric model of the Indonesian natural rubber market is required prior to the decomposition analysis. This model is provided by, respectively, a structural model of the Indonesian natural rubber market, a full reduced form price equation and a directly estimated price equation. All these functions are estimated under linear and static conditions and the estimated price equations are decomposed into the necessary effects.

One finding of this study is that there is very little response by the Indonesian natural rubber market to changes in the domestic natural rubber price, as shown by small values of the own-price elasticities of supply and demand. Further analysis indicates that the demand component is the dominant factor attributable to the Indonesian natural rubber price instability. The supply component and the supply-demand interaction effect are found to have lesser effects on the price instability. Within the demand component, the variance of the world natural rubber price is the main factor affecting the net intercept variance, indicating a strong relationship between the domestic price and the world price.

The main policy implication of this study is the need to tailor the Indonesian natural rubber industry more to market requirements, which can be done in two ways. First, at the international level, policy attention can be focused on different marketing strategies, possibly to the newly industrialised countries in Asia. Paying more attention to a lesser quality rubber, such as crumb rubber, would seem to have good prospects since this type of rubber has shown an increasing demand from neighbouring countries. Second, at the domestic level, rubber-based products, would seem to have a promising future. Focusing more on these industries is likely to increase domestic demand for natural rubber. Finally, the Indonesian natural rubber market cannot be improved without government intervention, especially in the forms of cost-reducing and quality-improving research, especially for small-scale producers.

Acknowledgments

This study would not have been completed without the contribution and support in various forms of the following persons.

I am especially grateful to my supervisor, Dr Garry Griffith, for his patience, encouragement and comprehensive guidance. I also thank him for his additional work throughout the preparation of this study.

Assoc. Prof. Roley R. Piggott also supervised this study, especially in the early stage of this dissertation. I am greatly thankful for his constructive suggestions.

I would like to express my gratitude to Dr. Euan Fleming for his supervision during my graduate diploma program and also to Assoc. Prof. Jack Sinden for his guidance for the first two semesters of my MEc candidature. Their encouragement during my study at UNE is really appreciated.

My colleague, I Gde Pitana, helped me collect the data. I am grateful for his help.

I am indebted to the staff of Indonesia Australia Eastern Universities Project and to the staff of Agriculture Faculty, University of Udayana, for encouraging me to take this study. Also I would like to extend my gratitude to the Australian International Development Assistance Bureau for providing financial support.

Finally, I express my special appreciation to my husband, Turah Rai, for his patience, sacrifices and support during the difficult circumstances of my study and pregnancy. I offer my gratitude to my two daughters, Putri and Dwinta, for their understanding during my study in Armidale.
