

The emergence of new energy technologies – economic and public policy implications of Australia’s changing electricity markets

**Timothy Andrew Nelson
B.Ec (Hons I) – University of New England**

A dissertation submitted for the degree of Doctor of Philosophy of the University of New England

Institute for Rural Futures, BCSS
University of New England
Armidale

April 2016

Declaration

I certify that the substance of this dissertation has not already been submitted for any degree and is not currently being submitted for any other degree of qualification.

I certify that any help received in preparing this dissertation and all sources have been acknowledged in this dissertation.

Acknowledgements

The most important source of inspiration for this dissertation has been my beautiful family. My wife, Juliana, has been a constant source of support and I love her dearly for it. My spirited and keenly intelligent children, Leo and Tom, have been the inspiration for my thinking about renewables, climate change and leaving the world a better place than I found it. I am optimistic that we have reached the point of inflexion and that the very disruption to the energy industry described in this dissertation will result in dangerous anthropogenic climate change being averted.

I have been lucky enough to have two supervisors. My ‘academic’ supervisor, Judith McNeill, has been a true source of inspiration. Judy has always been keen to provide encouragement and correct my ‘economist’s English’! My ‘industry’ supervisor, Paul Simshauser, has had the single biggest impact on my career of anyone I have worked with. I am lucky to have worked under Paul and am immensely proud of our contribution to the Australian energy and climate change public policy debate. I thank you sincerely Judy and Paul for your belief in me.

Much of this dissertation was written with the support of two important institutions. Firstly, AGL Energy Ltd under the guidance of Michael Fraser allowed me to dedicate time and effort to research energy markets, climate change and renewable energy. Secondly, the University of New England and its immensely talented staff opened my mind to a world outside the industry. In particular, Mahinda Siriwardana and the work completed as part of ARC Linkage Grant LP120200192: Adaptation to carbon-tax-induced changes in energy demand in rural and regional Australia was central to my ability to complete this thesis.

TABLE OF CONTENTS

Introduction		p. 5
Part 1	Embedded technology evolution and the consequences for the retail supply of electricity	p. 45
Chapter 2	Metering and the principal–agent problem in restructured energy markets	p. 46
Chapter 3	A new approach to congestion pricing in electricity markets: Improving user pays pricing incentives	p. 49
Chapter 4	From throughput to access fees – the future of retail and network tariffs	p. 52
Chapter 5	The role of the utility and pricing in the transition	p. 55
Chapter 6	The consequences of retail electricity price rises: rethinking customer hardship	p. 58
Chapter 7	Reconciling energy prices and social policy	p. 61
Part 2	Wholesale electricity markets, renewable energy and climate change	p. 64
Chapter 8	Energy-only markets and renewable energy targets: Complementary policy or policy collision?	p. 65
Chapter 9	Australia’s National Electricity Market – optimising policy to facilitate demand-side response	p. 68
Chapter 10	An analysis of Australia's large scale renewable energy target: Restoring market confidence	p. 71
Chapter 11	Australian climate change policy – where to from here?	p. 74
Conclusion		p. 77
Appendix 1	The Australian east coast gas supply cliff	p. 80
Appendix 2	Appendix 2: Australia's coal seam gas boom and the LNG entry result	p. 83
Appendix 3	Appendix 3: Relief in sight: Why residential electricity costs in Eastern Australia may fall between 2015 and 2020	p. 86
