
Functional Dynamics of Human Profilin I and II: Interaction with Phosphatidylinositol (4, 5) biphosphate and Poly-L-proline

Kannan Krishnan, *B. Sc., M. Sc., M. Tech.,*

**(B. Sc and M. Sc., Madurai Kamaraj University, Madurai, India.
M. Tech., Anna University Chennai, India.)**

A thesis submitted for the degree of Doctor of Philosophy

The University of New England

Supervisors:

Principal Supervisor: Dr. Pierre Moens

Co-Supervisor: Prof. Kenneth Watson

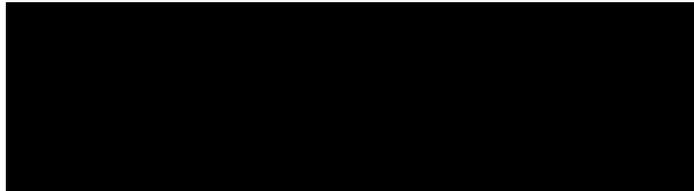

Center for Bioactive Discovery in Health & Ageing
School of Science & Technology

April 2009

Certification

I certify that the substance of this thesis has not already been submitted for any degree and is not currently being submitted for any other degree or qualification.

I certify that any help received in preparing this thesis, and all sources used, have been acknowledged in this thesis.

April 2009

Acknowledgements

At the end of my PhD, it is wonderful to recollect those who helped and to thank them. My journey started from Mallangapuram, Tamilnadu, India several years ago and I reached Armidale on April 2006. When I arrived in Armidale, a new city to me, my supervisor came to the railway station to pick me up and to accommodate me in Wright village. I never expected Armidale to be this cold, but managed for three years. My supervisor traveled with me to the Ludwig Institute for Cancer Research, Melbourne to show me how to grow GUV and how to record them under the confocal microscope. Again, he traveled with me to the Laboratory for Fluorescence Dynamics (LFD), University of California, Irvine, CA, USA to give me training with SimFCS and RICS analysis. I came to Armidale with very little knowledge about fluorescence and learned a lot during my PhD. Thank you Dr. Pierre Moens for all these things.

Prof. Ken Watson is my co-supervisor. He supported me to attend the Australian Society for Biophysics conference which helped me meet with Prof. Brett Hambly and Prof. Paul Curmi, experts in the biophysics field. Prof. Ken Watson, as a Head of the School, supported me to stay an additional one week in UCI, CA to conduct a few experiments in the LFD. Thanks very much Prof. Ken Watson for these important supports. Thanks very much for having proofread my thesis.

Thank you! The University of New England, Armidale and “The UNE experience will stay for life”. Good or bad, the experience in these three years will stay forever. My PhD is from UNE, Armidale, it is fixed for ever; cannot be changed. Without the UNERA scholarship and fee waiver, I could not have completed this thesis. Very generous of you and thank you UNE!

The School of Biological, Biomedical and Molecular Sciences (BBMS) was very attractive title of this school, however, the Faculty of Arts and Sciences is also very good. Though I felt initially that science is not an art, later I realized that doing science is an art. Thanks for the support and facilities of the School and the Department. I got an opportunity here to interact with nursing students while demonstrating practicals. Thanks for the opportunity to gain teaching experience (Gemma, Pierre, Gudrun, Kate, Tom and Graham). Some of the questions and comments during my seminars in this Department were encouraging. I thank all the academic and general staff of this department for their kind support.

I thank, Prof. Enrico Gratton for the SimFCS software, training and thanks for having allowed me to use the facilities in his lab for one month. I thank Dr. Susana A Sánchez, Dr. Michelle A Digman and Dr. Theodore L. Hazlett for their support during my visit to The LFD. I thank you Dr. Andrew Clayton and Dr. Stephen Cody for the confocal microscopy facility and other support.

I thank FABLS for a travel grant to carry out CD experiments at UNSW, Sydney. I thank ASB for a travel grant to attend Fluoro 2006 and the ASB conference. I thank AuPS for a travel grant to attend the ASB conference. I thank CCMB, CSIR for having granted me leave to finish this task at UNE.

When I arrived here in Armidale I did not know that I would receive sad news from my home back in India. My father passed away on 12 June 2006. Who should I turn to for comfort and support, God alone! I had to leave my wife and daughter in Armidale and go to India for three weeks. I thank Mrs. Uli Evered and Prof. Mark, Mrs. Julia Leong and Mr. Marke Leong and Dr. Heather Nonhebel who took care of my family in Armidale when I was in India.

I did not know which bank to go to, which cell phone to buy, which connection to avail, where are the supermarkets, where do I get Indian spices, what should I be careful of, how do I apply to rent an apartment. Even before arriving in Armidale, what to bring and what not to bring, how to apply for the Visa and so on, only was possible for Indian friends in UNE who had already gone through all these procedures. I thank, Dr. Amar Pandey, Dr. Suresh Kumar, Dr. Gunasekaran and Malar, Dr. Dalvinder Singh and family, Dr. Suresh Mohan Kumar and family, Dr. Zulfika and Ms. Sameera, Dr. Subba Reddygaru and family, Dr. Vinod and family, Dr. Mujib and family, Ms. Dharma and all other friends. They helped me a lot during my stay. They are there for scientific discussion, personal discussions and to help with anything and everything.

I received spiritual help from several churches in Armidale. I came and found St. Marks chapel just near to my department. I found the Baptist church near the bus stop and close to my residence as well. I found ACC on the way to the UNE. It was wonderful attending these churches.

I thank Greeta Nancy, my beloved wife. I thank my father, Krishnan Sivalingam, my mother, Kliammal Krishnan for their love and affection. I thank my brothers, Kalirajan and Maharajan and sisters, Easwari, Lakshmi, Annathai, Lingammal and Meena for their constant support and care. Armidale become one of the important places in my life not only because I did my PhD here, but also, my daughter, Judith Graziel was born here. I thank my daughters, Raphael and Judith for their special effort to distract me from stressful thoughts. My PhD is not just three years of work; rather it is three years of life in Armidale, Australia. My family here was a great support and encouragement. Life goes on; research goes on; and learning goes on; only the PhD work is finished here.

Table of content

Abstract	1
Chapter 1: Introduction	
Title: Functional dynamics of profilins	
Abstract.....	4
Profilin Isoforms:.....	6
Profilin and actin polymerization dynamics:.....	7
Profilin and phosphatidylinositol 4, 5-bisphosphate:.....	7
Profilin and Poly-L-Proline:.....	9
Phosphorylation of profilin:.....	9
Stabilities of profilin and profilin mutants:.....	10
Profilin and Cancer:.....	11
References:.....	12
Legends to figures:.....	19

Abstract

Profilins are small (~14 kDa) actin binding proteins found in eukaryotes and certain viruses. Profilins are implicated in cytokinesis, membrane trafficking, cell development and cell motility. Apart from actin, profilins also interact with polyphosphoinositides and proline rich domains containing proteins. However, the role of its interaction with Phosphatidylinositol (4, 5) bisphosphate PI(4,5)P₂ is still poorly understood. In this work, the interaction between profilin and PI(4,5)P₂ was investigated using Giant Unilamellar Vesicles (GUV), a model of the cell membrane. Using Number and Brightness analysis, it was demonstrated that, in the absence of profilin, molar ratios of PI(4,5)P₂ above 4% resulted in lipid demixing and cluster formations. Furthermore, adding profilin to GUVs made with 1% PI(4,5)P₂ led to the formation of clusters in the presence of profilin. The diffusion coefficient of PI(4, 5)P₂ measured on GUV membranes showed large variations but the overall diffusion coefficient change, with and without profilin confirmed the cluster formation.

Using LAURDAN GP, we found that 16% of PI(4, 5)P₂ molecules on GUVs formed domains that were 2500 nm² in size. When profilin was added, the membranes become more water accessible suggesting differences in the domains in the absence and presence of profilin, however, the domain size remained the same.

Phosphorylation of profilin has been previously reported, however, the interaction of phospho-profilin on model membranes has not been studied. Our results with respect to PI(4, 5)P₂ interaction suggested that profilin phosphorylation does not affect its interaction with PI(4, 5)P₂ on the membrane. Furthermore, the cluster formation on GUV membranes was similar to that of wild-type profilin.

There are four isoforms of profilin present in humans, apart from the spliced forms of profilin-II. The significance of the presence of these isoforms is not clearly understood. We carried out equilibrium unfolding studies on profilin I and profilin IIA, with and without poly-L-proline. Our results revealed the stabilization effects of poly-L-proline on both profilin isoforms. Our data demonstrated that the stabilization effect of poly-L-

proline was greater for profilin-I than profilin-II but that profilin II was intrinsically more stable than profilin I. 1-anilino-8-naphthalene sulphonate fluorescence revealed that there were non-polar binding sites, which are buried in the native state, and become exposed at a low denaturant concentration. These results suggest that profilin binding to proteins containing proline rich domains would stabilize their structure which would have important effects on the dynamics and regulation of profilins function.
